

AI Opportunity Assessment Workshop

A focused 2-day workshop to discover where AI creates real value across your business, pressure-test the best ideas, and leave with a clear, prioritized blueprint your whole team believes in — technical and non-technical alike.

WHAT YOU WALK AWAY WITH

1 AI Opportunity Blueprint

A visual map of your top opportunities, plotted by business impact against implementation effort.

2 A New Perspective on AI & Implementation

A sharper, grounded view of where AI genuinely fits — and a realistic read on what putting it to work actually takes.

3 Prioritized Use Cases

Concrete opportunities ranked by value and feasibility, with impact and effort noted for each.

4 Team Alignment

Everyone leaves with one shared language for where AI fits — and the confidence to move.

THE FRAMEWORKS WE USE

Task Decomposition. Break each function's work into discrete tasks — we evaluate the task, not the job title.

AI Capability Lenses. Test every task against what AI does: predict, see, read & write, listen & speak, generate.

Suitability-for-AI Screen. A rapid rubric (adapted from Stanford research) that separates real AI fits from wishful thinking.

Automate vs. Augment. Decide whether AI replaces a task or assists the person doing it.

Value vs. Effort Matrix. Plot every candidate and prioritize what to pursue first.

HOW THE TWO DAYS WORK

DAY 1 Discover & Generate

- ◆ **Map the landscape.** Where AI is already in use across the team, and the most time-consuming work in each function.
- ◆ **Generate in small groups.** Mixed technical and non-technical teams run their tasks through the capability lenses to surface a wide set of opportunities — volume first.
- ◆ **Surface the signal.** Groups share back, then run the candidates through the Suitability-for-AI rubric to test whether AI can genuinely deliver.

DAY 2 Screen, Prioritize & Prototype

- ◆ **Pressure-test the winners.** Decide automate vs. augment, and stress each one on data, scope, and risk.
- ◆ **Assess complexity.** Size how hard each candidate is to actually build, using a simple combined estimation approach — so the "effort" call is grounded, not guessed.
- ◆ **Build the blueprint.** Plot everything on the Value vs. Effort matrix and lock your prioritized set of opportunities.
- ◆ **Prototype with agentic coding tools.** Stand up a quick proof-of-concept of a top opportunity live — so the team sees what "real" looks like, not just a plan.

FORMAT Built to run for your team

- ◆ Delivered **on-site or virtual**, structured so the energy and output hold across both days.
- ◆ **Industry-agnostic by design.** The frameworks surface opportunities in *your* business — we adapt them to your context live, in the room.

Stanford CSP, Supervising AI Agents class, Spring 2025

WHY ME

- ◆ **AI Technical Lead @ Stanford.** Building AI tools for Stanford Legal Design Lab partners.
- ◆ **AI Instructor @ Stanford.** Teaching a diverse cohort of professionals on agentic coding and AI-generated code quality control.
- ◆ **5+ years of AI consulting and development** for private and public companies — independently and alongside consulting giants such as McKinsey or FTI Consulting.
- ◆ **Built a logistics company** from scratch to **\$10M revenue** and sold my interest.
- ◆ **A diverse AI consulting & development background** across edutech, logistics, copper & gold mining, healthtech, and legal — a cross-industry lens most advisors don't have.

INVESTMENT

TBD

Vasyl Rakivnenko

AI Technical Lead, Stanford Law School (Legal Design Lab)
Instructor, AI · Stanford Continuing Studies
